Abstract: PROBLEM TO BE SOLVED: To provide an IC socket for an IC having electrodes on both surfaces.

SOLUTION: The IC socket 2 comprises a contact part contacting with respective electrodes of the IC, a base part supporting the contact part, first and second contacts 12, 14 connecting respective electrodes of the IC to a testing device, and a socket body 10 holding the base part of the respective contacts 12, 14. A guide plate 28 energized in the direction of parting from the socket body 10, a table 30 energized in the direction of parting from the socket body 10, a pushing pad 32 pivotally mounted the socket body so as to be able to freely move, energizing the IC toward a pushing position where the IC is pushed, and a cover 34 making respective contact parts of the first and the second contacts 12, 14 contact with the electrodes of the IC which is pressed against the table 30 by the pressing pad 32, are mounted to the one side of the socket body.
